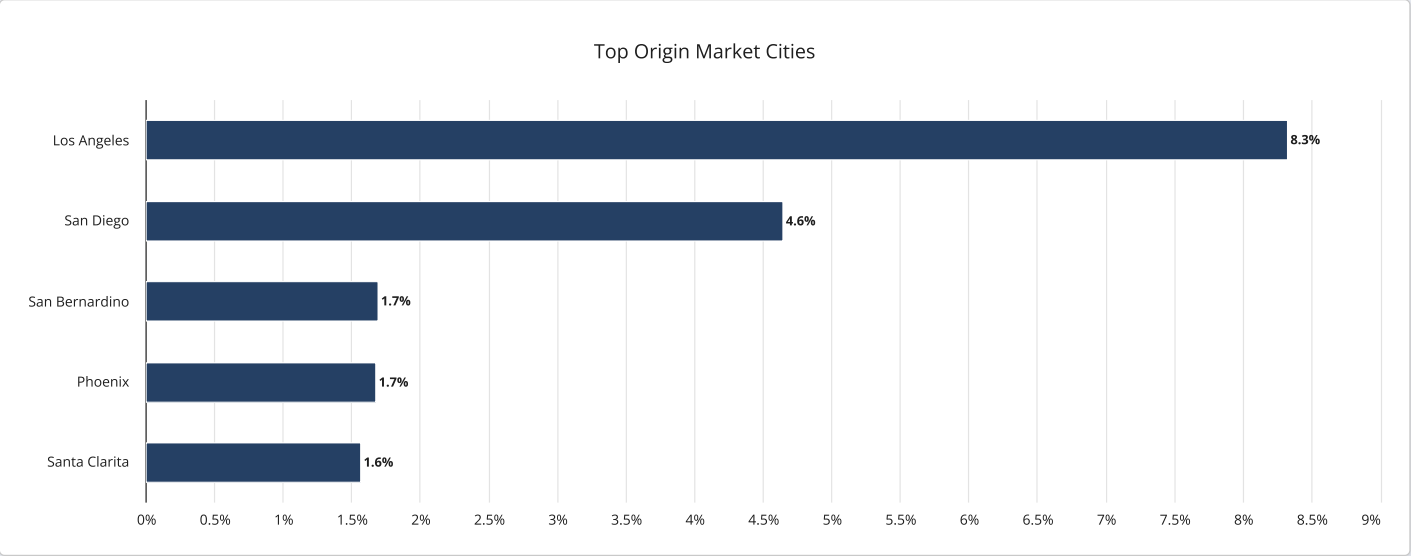
How much are visitors contributing to your economy?

Source: Zartico spending data

% of all Restaurant Spend - Visitor	% of all Retail Spend - Visitor	% of all Accommodations Spend - Visitor
20%	**14%**	**78%**
↘ -11% change · 22% prev. year	↘ -25% change · 19% prev. year	↗ 2% change · 76% prev. year

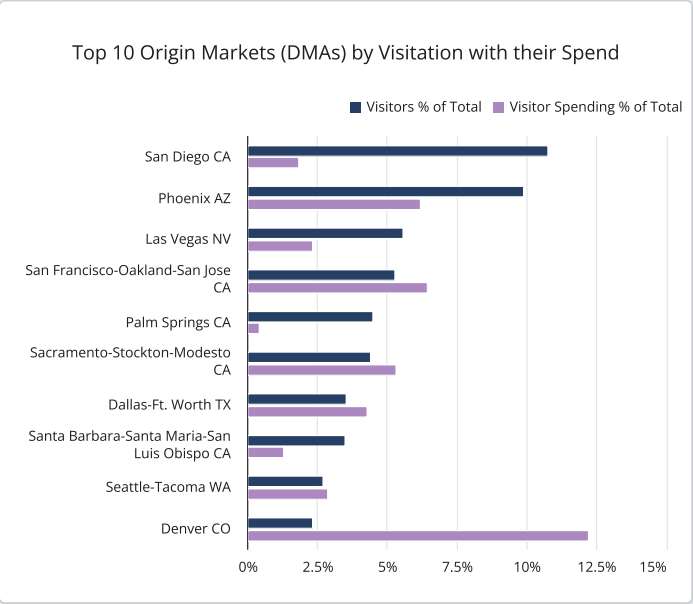
Who is visiting your destination?

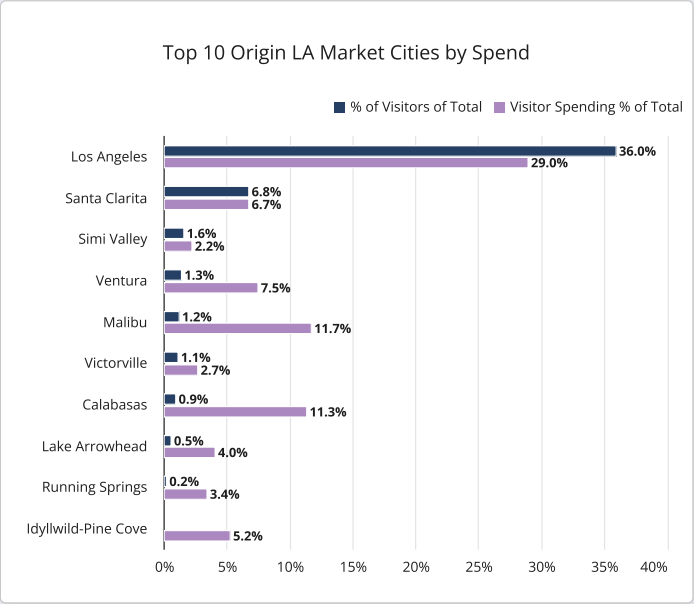
Source: Zartico Geolocation Data. Note: This insight shows which origin cities generate the greatest volume of visitors, which helps you understand your visitation patterns to inform your marketing and promotional efforts. Visitors are defined as devices more than 50 miles from their home and work locations. This insight displays only origin market cities, not origin market DMAs, which encompass many cities and are used in other marketing-related insights in the platform.



Which markets are generating the greatest economic impact?

Source: Zartico Geolocation Data and Zartico Spend Data. Note: The blue bars represent your largest origin markets. The purple bars show each origin market's % of spending. Tip: Look for markets with higher spending (purple) compared to their share of visitation (blue). Right side: Top spending origin cities in Los Angeles DMA (purple) and how it compares to visitation (blue).





Which Regions and Categories are Visitors going to?

Sample Size Reference

These metrics provide a reference for the number of unique visitor devices (Zartico Geolocation Data) and cardholders (Zartico Spend Data) used in the insights above. These values are controlled by the combination of filters selected at the top of the module. Typically, an annual visitor survey conducted for a destination includes between 600 - 2,000 survey responses. In statistics, larger sample sizes result in smaller margins of error (%+/-) and a higher confidence interval. This means that it is less likely that the result you are seeing is due to statistical noise and the greater the confidence you can have in the insights being provided. If these diagnostics show yellow or red values, the insights should be treated as directionally, but less precise owing to a smaller sample size. In these cases, eliminating filter criteria at the top of the module or widening the date range will increase the sample size and increase both accuracy and confidence in the data.

Visitor Device Count Sample Size	Visitor Cardholder Count Sample Size
