Glossary

Geolocation

Cluster : A group of points of interest (POIs). They could be based on factors like venue type or visitor purpose.

Share of Trips : Measures the presence of a particular market by the percentage of which it makes up the destination's total trips. For example: If your destination had a total of 80 trips, and 20 of those visitors came from New York, New York would have a 25% share of trips.

Share of Visitor Days : Measures the presence of a particular market by indicating the percentage of its individual visitor days compared to the total number of visitor days. For example, if visitors from San Francisco showed 20 visitor days out of a total of 80 visitor days, San Francisco witnessed a 25% share of visitor days.

Trips : The number of distinct trips by a visitor to a destination or POI. We calculate this using a combination of observation patterns and distance traveled. For example, if a visitor comes in-market Thursday - Sunday, it only counts as one trip. If they return later in the month, that is counted as a second trip.

Trip Length : Measures how long, in consecutive days, the visitor spent in the destination.

Unique Device : A unique mobile device used to gather an estimate of the unique/individual visitors to a given POI or cluster.

Visitor Days : An estimate of the number of daily visitors to a given POI or cluster of POIs. The daily estimate can be calculated based on whichever date range is selected by the users.

Advanced Spending

Total Spend : The total estimated spend for all visitors for the applied date range and filter settings.

Total Trips : The estimated number of unique "trips" to a destination. If a cardholder visits in March, and then returns in June this would be considered two separate trips.

Spend Volume : The total estimated dollars spent.

Average Spend per Trip : The average cumulative amount spent by each visitor during a trip. If a visitor completed four transactions during a trip that were $25 each, then the spend for this visitor for this trip would be $100.

© Datafy - All Rights Reserved

Glossary

Repeat Spenders : If we see a cardholder make two or more trips to the destination (using all of our historical data, not just the filtered dates), then they are considered a “Repeat Spender.” If the cardholder has only made one trip to the destination, then they are considered “One Time”.

Length of Stay : Length of stay is determined as the difference between the first transaction on a trip and the last transaction on a trip for an individual cardholder. We recommend toggling the “Primary Cards” option when looking at length of stay to remove cards that a visitor may only use infrequently, and thus will skew towards 1-day trips.

Merchant Location : Available as a filter. The merchant location reflects the zip code or county where the transaction took place.

Demographics

Education : We can report on the education level of households into three categories: high school degree, bachelor’s degree, and graduate degree.

Age : Age is calculated by aggregating and weighting the age groups of the known members of the household, based on the probability of someone in each age group being present in the household. For example, if the report shows 15% in the 65+ category, 15% of your visitors have someone 65+ in their household.

Ethnicity : Demographics like ethnicity are pulled from the household profile that the device is associated with, and classified based on the definitions provided by the U.S. Census Bureau.

Households with Children : Reports on the percentage of households that have someone under the age of 18 living in them.

Census Demographics : We calculate the home zip code of the device and then link that user’s demographics, social, housing, and economic characteristics by using data from the U.S. Census and American Community Survey.
